# Algorithm for file updates in Python

### **Project description**

At a Healthcare organization, access to restricted content is controlled with an allow list of IP addresses. The "allow\_list.txt" file identifies these IP addresses. A separate remove list identifies IP addresses that should no longer have access to this content. I created an algorithm to automate updating the "allow\_list.txt" file and remove these IP addresses that should no longer have access.

### Open the file that contains the allow list

To open the file that contains allow list I imported the file to a variable called import\_file and used the command with open(import\_file, "r") as file:

```
# Assign `import_file` to the name of the file
import_file = "allow_list.txt"

# Assign `remove_list` to a list of IP addresses that are no longer allowed to access restricted information.

remove_list = ["192.168.97.225", "192.168.158.170", "192.168.201.40", "192.168.58.57"]

# First line of `with` statement
with open(import_file, "r") as file:
```

#### Read the file contents

To read the file contents I used the command with open(import\_file, "r") as file: followed by the read function ip\_addresses = file.read()

```
# Assign `import_file` to the name of the file
import_file = "allow_list.txt"

# Assign `remove_list` to a list of IP addresses that are no longer allowed to access restricted information.

remove_list = ["192.168.97.225", "192.168.158.170", "192.168.201.40", "192.168.58.57"]

# Build `with` statement to read in the initial contents of the file

with open(import_file, "r") as file:

# Use `.read()` to read the imported file and store it in a variable named `ip_addresses`

ip_addresses = file.read()

# Display `ip_addresses`

print(ip_addresses)
```

 $\begin{array}{l} \text{ip\_address 192.168.205.12 192.168.6.9 192.168.52.90 192.168.90.124 192.168.186.176 192.168.133.188 192.168.218.219 192.168.52.37 192.168.69.116 \\ \end{array}$ 

#### Convert the string into a list

To convert a string to a list I used the command ip\_addresses = ip\_addresses.split(). The split function converts a string to a list.

```
# Assign `import_file` to the name of the file
import_file = "allow_list.txt"

# Assign `remove_list` to a list of IP addresses that are no longer allowed to access restricted information.

remove_list = ["192.168.97.225", "192.168.158.170", "192.168.201.40", "192.168.58.57"]

# Build `with` statement to read in the initial contents of the file

with open(import_file, "r") as file:

# Use `.read()` to read the imported file and store it in a variable named `ip_addresses`
ip_addresses = file.read()

# Use `.split()` to convert `ip_addresses` from a string to a list
ip_addresses = ip_addresses.split()

# Display `ip_addresses`
print(ip_addresses)

['ip_addresses', '192.168.205.12', '192.168.6.9', '192.168.52.90', '192.168.90.124', '192.168.186.176', '192.168.133.188', '192.168.218.219', '192.168.52.37', '192.168.156.224', '192.168.60.153', '192.168.69.116']
```

## Iterate through the remove list

To iterate through the remove list, I used the for loop and named the loop variable element with the command for element in ip\_addresses:

```
# Assign `import file` to the name of the file
import_file = "allow_list.txt"
# Assign `remove_list` to a list of IP addresses that are no longer allowed to access restricted information.
remove_list = ["192.168.97.225", "192.168.158.170", "192.168.201.40", "192.168.58.57"]
# Build `with` statement to read in the initial contents of the file
with open(import file, "r") as file:
  # Use `.read()` to read the imported file and store it in a variable named `ip addresses`
  ip addresses = file.read()
# Use `.split()` to convert `ip_addresses` from a string to a list
ip_addresses = ip_addresses.split()
# Build iterative statement
# Name loop variable `element`
# Loop through `ip_addresses`
for element in ip_addresses:
   # Display `element` in every iteration
   print(element)
ip_address
192.168.205.12
192.168.6.9
192.168.52.90
192.168.90.124
192.168.186.176
192.168.133.188
192.168.218.219
192.168.52.37
192.168.156.224
192.168.60.153
192.168.69.116
```

#### Remove IP addresses that are on the remove list

To remove the IP addresses that are on the remove list I built the condition using if statement.

if element in remove list:

ip\_addresses.remove(element)

```
# Assign `import file` to the name of the file
import file = "allow list.txt"
# Assign `remove_list` to a list of IP addresses that are no longer allowed to access restricted information.
remove_list = ["192.168.97.225", "192.168.158.170", "192.168.201.40", "192.168.58.57"]
# Build `with` statement to read in the initial contents of the file
with open(import file, "r") as file:
  # Use `.read()` to read the imported file and store it in a variable named `ip addresses`
  ip addresses = file.read()
# Use `.split()` to convert `ip addresses` from a string to a list
ip_addresses = ip_addresses.split()
# Build iterative statement
# Name loop variable `element`
# Loop through `ip_addresses`
for element in ip_addresses:
  # Build conditional statement
  # If current element is in `remove_list`,
    if element in remove_list:
        # then current element should be removed from `ip_addresses`
        ip_addresses.remove(element)
# Display `ip_addresses`
print(ip_addresses)
['ip_address', '192.168.205.12', '192.168.6.9', '192.168.52.90', '192.168.90.124', '192.168.186.176', '192.168.133.188', '192.168.218.219', '192.168.52.37', '192.168.156.224', '192.168.60.153', '192.168.69.116']
```

### Update the file with the revised list of IP addresses

To update the file with the revisesd ip addresses I used the join funtion to convert the list back to string since the original file was in string and opened the import\_file with a write argument and used the write function.

```
ip_addresses = " ".join(ip_addresses)
with open(import_file, "w") as file:
file.write(ip_addresses)
```

```
# Assign `import file` to the name of the file
import file = "allow list.txt"
# Assign `remove_list` to a list of IP addresses that are no longer allowed to access restricted information.
remove_list = ["192.168.97.225", "192.168.158.170", "192.168.201.40", "192.168.58.57"]
# Build `with` statement to read in the initial contents of the file
with open(import file, "r") as file:
  # Use `.read()` to read the imported file and store it in a variable named `ip addresses`
  ip addresses = file.read()
# Use `.split()` to convert `ip addresses` from a string to a list
ip addresses = ip addresses.split()
# Build iterative statement
# Name loop variable `element`
# Loop through `ip_addresses`
for element in ip_addresses:
  # Build conditional statement
  # If current element is in `remove_list`,
    if element in remove_list:
         # then current element should be removed from `ip_addresses`
        ip addresses.remove(element)
# Display `ip_addresses`
print(ip_addresses)
['ip_address', '192.168.205.12', '192.168.6.9', '192.168.52.90', '192.168.90.124', '192.168.186.176', '192.168.133.188', '192.168.218.219', '192.168.52.37', '192.168.156.224', '192.168.60.153', '192.168.69.116']
# Convert `ip addresses` back to a string so that it can be written into the text file
ip_addresses = " ".join(ip_addresses)
# Build `with` statement to rewrite the original file
with open(import_file, "w") as file:
 # Rewrite the file, replacing its contents with `ip_addresses`
 file.write(ip_addresses)
# Build `with` statement to read in the updated file
with open(import file, "r") as file:
    # Read in the updated file and store the contents in `text`
   text = file.read()
# Display the contents of `text`
print(text)
ip address 192.168.205.12 192.168.6.9 192.168.52.90 192.168.90.124 192.168.186.176 192.168.133.188 192.168.218.219 192.168.52.3
7 192.168.156.224 192.168.60.153 192.168.69.116
```

## Summary

I created an algorithm that removes IP addresses identified in a remove\_list variable from the "allow\_list.txt" file of approved IP addresses. This algorithm involved opening the file, converting it to a string to be read, and then converting this string to a list stored in the variable ip\_addresses. I then iterated through the IP addresses in remove\_list. With each iteration, I
evaluated if the element was part of the ip\_addresses list. If it was, I applied the .remove()
method to it to remove the element from ip\_addresses.. After this, I used the .join() method to
convert the ip\_addresses back into a string so that I could write over the contents of the
"allow\_list.txt" file with the revised list of IP addresses.
